Evaluation of regression formulae for estimating height and body weight at birth from maternal measurements during pregnancy. To evaluate the accuracy of birth size prediction using formulae derived from maternal anthropometry. Data from a population-based cohort study were used to evaluate the performance of two regression formulae for birth size predictions. The results showed that, among newborns, the sex and the gestational age-adjusted formulae performed better than the unadjusted and all other forms of the equations. The prediction accuracy of the formulae also varied by gestational age, and these accuracies were

higher for formula use at 28 weeks' gestation. Among formula users, the best results were obtained when the estimated gestational age was calculated using both the maternal weight and the corresponding measured birth size. This improvement was lost when the estimated gestational age was calculated using a single estimate. Among formula users, the difference in birth size between predicted and measured birth sizes was similar for weight and height, but was higher for longer birth lengths. Formulae for predicting birth size from maternal measurements during pregnancy were more accurate for weight than for length. This was achieved by first converting the birth size to an estimated gestational age based on the weight, and then converting this to an estimated birth size based on the measured birth size. These formulae need to be evaluated in other populations.

A new type of siloxane and a new type of ring with the new molecular structure of siloxy-silane-silicone (SRIS): synthesis and use in the formation of nano-particles with emissive properties. A new type of siloxane with the molecular structure of a siloxane-silicone (SRIS) has been prepared by the reaction of a disiloxane ($H(2)SiOSiOSiH(2)$) with silicon tetrachloride. The structure of the product was confirmed by its crystal structure and by its IR, NMR and mass spectral data. The aim of the study is to provide a way for synthesising a new type of siloxane, a siloxane-silicone of a new molecular structure, and to examine its feasibility for application in the 82157476af
